

New York General Group Master Plan to the Year 2100

1. New York General Group Master Plan to the Year 2100

Create and Save the Universe by Superintelligence

Human civilization has advanced through revolutions in energy, information, and intelligence. Today, we stand at the beginning of a new era in which intelligence itself becomes the world's most important infrastructure.

New York General Group's mission is to **accelerate humanity's transition to a superintelligent civilization by developing technologies that expand human intelligence rather than replace it. Through the integration of Artificial Intelligence, Quantum Computing, Aerospace, and Healthcare, we aim to build the intelligent foundation for humanity over the next thousand years and beyond. This vision reflects our corporate mission of “**Create and Save the Universe by Superintelligence.**”**

2. The Vision: World System

World System is not simply a metaverse platform, an AI platform, or a quantum computing platform. It is the integration of all three into a single intelligent operating system for civilization.

The metaverse becomes the universal interface where people work, learn, conduct research, collaborate, and innovate. Artificial intelligence becomes the cognitive engine that supports discovery and decision-making. Quantum computing becomes the computational backbone that enables solutions to problems beyond the capabilities of classical computing.

Together, these technologies create an intelligent infrastructure where human knowledge continuously grows and benefits everyone.

3. Categorical AI: AI for Discovery

At the core of World System is **Categorical AI**, New York General Group's foundational technology.

Unlike conventional AI, which focuses on prediction and content generation, Categorical AI is designed for **scientific discovery, technological invention, and structural reasoning**. Built on category theory and systems theory, it identifies relationships across disciplines, generates new hypotheses, and assists researchers and engineers in solving problems that have never been solved before.

Our objective is not to automate human intelligence, but to amplify human creativity and accelerate innovation across every scientific and industrial field. This positioning is consistent with the company's published description of Categorical AI as an AI designed for discovery rather than prediction.

4. Building the Intelligence Infrastructure

World System connects people, organizations, and intelligent systems through a common global platform.

Universities contribute research. Companies develop intelligent applications. Governments provide digital public services. Healthcare institutions deliver personalized medicine. Scientists collaborate globally. Developers create new AI-powered products.

Behind this ecosystem, hybrid computing dynamically combines classical supercomputers with quantum computers, allowing users to solve increasingly complex scientific, industrial, and societal challenges without needing expertise in quantum computing itself.

Every new discovery strengthens the intelligence of the entire platform.

5. From Intelligence to Civilization

World System is designed to become humanity's long-term intelligence infrastructure.

Its development follows four stages: first, creating a natural digital environment where humans and AI collaborate; second, connecting industries, research institutions, governments, and enterprises into one intelligent network; third, integrating quantum computing into everyday AI workflows to enable unprecedented scientific breakthroughs; and finally, extending this intelligent infrastructure beyond Earth to support a sustainable multi-planetary civilization.

This roadmap reflects New York General Group's broader vision of integrating AI, aerospace, and healthcare to support humanity's future.

6. Master Plan to the Year 2100

Our objective is not to build a single product.

Our objective is to transform civilization.

We are building an intelligent infrastructure where every scientific discovery accelerates the next discovery, every invention expands humanity's collective knowledge, and every person gains access to superintelligence.

We are not building the next application.

We are not building the next AI model.

We are building the intelligence infrastructure for the next civilization.

Create and Save the Universe by Superintelligence.
